CS761 Spring 2015 Homework 2

Assigned Mar. 13, due Mar. 27 before class

Instructions:

- Homeworks are to be done individually.

- Typeset your homework in latex using this file as template (e.g. use pdflatex). Show your derivations.

- Hand in the compiled pdf (not the latex file) online. Instructions will be provided. We do not accept hand-written homeworks.

- Homework will no longer be accepted once the lecture starts.

- Fill in your name and email below.

Name: Max Horowitz-Gelb
Email: horowitzgelb@wisc.edu

1. Let $X_0, X_1, \ldots, X_{M-1}$ denote a random sample of N-dimensional random vectors X_n, each of which has mean value m and covariance matrix R. Show that the sample mean

$$\hat{m}_t = \frac{1}{t+1} \sum_{n=0}^{t} X_n$$

and the sample covariance

$$S_t(\hat{m}_t) = \frac{1}{t+1} \sum_{n=0}^{t} (X_n - \hat{m}_t)(X_n - \hat{m}_t)^\top$$

may be written recursively as

$$\hat{m}_t = \frac{t}{t+1} \hat{m}_{t-1} + \frac{1}{t+1} X_t, \quad \hat{m}_0 = X_0,$$

and

$$S_t(\hat{m}_t) = Q_t - \hat{m}_t \hat{m}_t^\top,$$

where

$$Q_t = \frac{t}{t+1} Q_{t-1} + \frac{1}{t+1} X_t X_t^\top.$$

i.

Assume that for some $t > 0$

$$\hat{m}_{t-1} = \frac{t-1}{t} \hat{m}_{t-2} + \frac{1}{t+1} X_{t-1}$$

then

$$\frac{t}{t+1} \hat{m}_{t-1} + \frac{1}{t+1} X_t$$

$$= \frac{t}{t+1} \frac{1}{t} \sum_{n=0}^{t-1} X_n + \frac{1}{t+1} X_t$$

$$= \frac{1}{t+1} \sum_{n=0}^{t} X_n$$

$$= \hat{m}_t$$

Then since clearly

$$\hat{m}_1 = \frac{1}{2} \hat{m}_0 + \frac{1}{2} X_1$$

Then for all $t > 0$

$$\hat{m}_t = \frac{t}{t+1} \hat{m}_{t-1} + \frac{1}{t+1} X_t$$

2

2. Suppose we roll a fair 6-sided die 100 times. Let X be the sum of the outcomes. Bound $P(|X - 350| \geq 100)$ using Chebyshev and Hoeffding, respectively.

X is the sum of n iid outcomes, $Y_1...Y_n$.

$$E[Y_i] = 7/2$$
$$Var[Y_i] = 35/12$$

Therefore

$$E[X] = \sum_{i=1}^{100} E[Y_i] = 350$$

$$Var[X] = \sum_{i=1}^{100} Var[Y_i] = 291 + 2/3$$

Therefore by the Chebyshev inequality

$$Pr(|X-350| \geq 100) = Pr(|X-350| \geq \frac{100}{\sqrt{291 + 2/3}}\sqrt{291 + 2/3}) \leq \frac{291 + 2/3}{10000}$$

And by the Hoeffding inequality

$$Pr(|X - 350| \geq 100) \leq 2\exp\left(-\frac{20000}{\sum_{n=1}^{100}(6 - 1)^2} \right) = 2\exp(-8)$$

3. Let $\mathcal{X}$ be the vector space of *finitely* nonzero sequences $X = (x_1, x_2, \ldots, x_n, 0, 0, \ldots)$. Define the norm on $\mathcal{X}$ as $\|X\| = \max|x_i|$. Let X_n be a point in $\mathcal{X}$ (a sequence) defined by

$$X_n = \left(1, \frac{1}{2}, \frac{1}{3}, \ldots, \frac{1}{n}, 0, 0, \ldots \right).$$

- Show that the sequence X_n is a Cauchy sequence.

  The sequence X_n is a Cauchy sequence. Let $\epsilon > 0$ be given. Then let $N = \lceil 1/\epsilon \rceil$. Then for any $l, s > N$ such that $l \leq s$

  $$\|x_s - x_l\| = \|(0, 0, ..., 1/(l+1), ..., 1/s, 0, ..., 0)\| = 1/(l+1) < 1/N \leq \epsilon$$

- Show that $\mathcal{X}$ is not complete.

$\mathcal{X}$ is not complete since $\|X_n - X_{n-1}\|$ converges to 0 which implies that as $n \to \infty, X_{n-1} \to X_n$ and this would imply that the number of non-zero elements of X_{n-1} would have to go to ∞, which is not finite, and so X_{n-1} is not in $\mathcal{X}$.

3

4. Determine the range and nullspace of the following linear operators (matrices):

$$A = \begin{bmatrix} 1 & 0 \\ 5 & 4 \\ 2 & 4 \end{bmatrix} \quad B = \begin{bmatrix} 1 & 0 & 1 \\ 5 & 4 & 9 \\ 2 & 4 & 6 \end{bmatrix}$$

A has a null space of $\vec{0}$ and range equal to $\text{span}([1,5,2]^\top, [0,4,4]^\top)$

B has a null space equal to $\text{span}([-1,-1,1]^\top)$ and a range equal to $\text{span}([1,5,2]^\top, [0,4,4]^\top)$.

5. Let

$$A = \begin{bmatrix} 1 & 4 & 5 & 6 \\ 6 & 7 & 2 & 1 \end{bmatrix} \quad b = \begin{bmatrix} 48 \\ 30 \end{bmatrix}.$$

One solution to $Ax = b$ is $x = [1,2,3,4]^\top$. Compute the least-squares solution using the SVD (explain how), and compare. Why was the solution chosen?

6. Consider the following process. A probability vector $p = (p_1, \ldots, p_d)$ is drawn from a Dirichlet distribution with parameter vector α. Then, a vector of category counts $x = (x_1, \ldots, x_d)$ is drawn from a multinomial distribution with probability vector p and number of trials N. Give an analytic form of $P(x \mid \alpha)$.

7. Let $X_1, X_2, \ldots, X_m$ be a random sample, where $X_i \sim U(0, \theta)$ the uniform distribution.

   - Show that $\hat{\theta}_{ML} = \max X_i$.
   - Show that the density of $\hat{\theta}_{ML}$ is $f_\theta(x) = \frac{m}{\theta^m} x^{m-1}$.
   - Find the expected value of $\hat{\theta}_{ML}$.
   - Find the variance of $\hat{\theta}_{ML}$.

Under the uniform distribution the likelihood for $\theta > 0$ is equal to

$$L(\theta | x_1, ..., x_m) = \prod_{i=1}^{m} \mathbb{1}(x_i <= \theta) * 1/\theta$$

Therefore clearly since θ is positve the maximum likelihood estimator is $\max X_i$

Since $\hat{\theta}_{ML}$ is the max order statistic then it has density,

$$f_\theta(x) = m * F(x)^{m-1} * f(x-1) = m * (x/\theta)^{m-1} * 1/\theta = \frac{m}{\theta^m} x^{m-1}$$

$$E[\hat{\theta}_{ML}] = \int_0^\theta = x * \frac{m}{\theta^m} x^{m-1} = \frac{m}{m+1}\theta$$

4

$$E[\hat{\theta}^2_{ML}] = \int_0^\theta = x^2 * \frac{m}{\theta^m} x^{m-1} = \frac{m}{m+2} \theta^2$$

$$Var[\hat{\theta}_{ML}] = E[\hat{\theta}^2_{ML}] - E[\hat{\theta}_{ML}]^2 = (\frac{m}{m+2} - \frac{m^2}{(m+1)^2}) \theta^2$$

8. Let $X_1, \ldots, X_n$ be a sample from $N(\mu, \sigma^2)$.

- Show that the MLE of σ^2 is

$$\hat{\sigma}^2 = n^{-1} \sum_{i=1}^n (X_i - \bar{X})^2.$$

Since the maximum likelihood of σ^2 is dependent on μ we must consider a likelihood funciton that is a function of $\hat{\sigma}^2$ and $\hat{\mu}$. So for $\hat{\mu}$ we will use the MLE of μ, which is $\bar{X}$. Then the likelihood function is

$$L(X|\sigma^2 = \hat{\sigma}^2, \mu = \hat{\mu}) = (2\pi\hat{\sigma}^2)^{-n/2} \exp \left(-1/2\hat{\sigma}^2 * \sum_i (X_i - \hat{\mu})^2 \right)$$

Minimizing this is equivalent to minimimizing the log,

$$-n/2 * log(2\pi) - n/2 * log(\hat{\sigma}^2) - 1/2\hat{\sigma}^2 * \sum_i (X_i - \hat{\mu})^2$$

The derivative of this with respect to $\hat{\sigma}^2$ is ,

$$\frac{-n}{2\hat{\sigma}^2} + \frac{\sum_i (X_i - \hat{\mu})^2}{2\hat{\sigma}^2}$$

which when $\hat{\mu} = \bar{X}$ and $\hat{\sigma}^2 = n^{-1} \sum_i (X_i - \bar{X})^2$ is equal to

$$\frac{-n^2}{2 \sum_i (X - \bar{X})^2} + \frac{n^2 * \sum_i (X - \bar{X})^2}{2 \left(\sum_i (X_i - \bar{X})^2 \right)^2} = 0$$

- Show that $\hat{\sigma}^2$ has a smaller mean squared error than

$$(n-1)^{-1} \sum_{i=1}^n (X_i - \bar{X})^2.$$

We know that the above is the sample variance, which we will call $\hat{\sigma}^2_{sv}$, has the properties,

$$E[\hat{\sigma}^2_{sv}] = \sigma^2$$

$$Var(\hat{\sigma}^2_{sv}) = 2\sigma^4/(n-1)$$

5

Since
$$\hat{\sigma}^2 = (n-1)/n * \hat{\sigma}_{sv}^2$$

then,
$$E[\hat{\sigma}^2] = (n-1)/n * \sigma^2$$

$$Var(\hat{\sigma}^2) = (n-1)^2/n^2 * 2\sigma^4/(n-1) = \frac{2(n-1)\sigma^4}{n^2}$$

The MSE of an estimator is its variance plus bias squared so,
$$MSE(\hat{\sigma}_{sv}^2) = 2\sigma^4/(n-1)$$

and,
$$MSE(\hat{\sigma}^2) = \frac{2(n-1)\sigma^4}{n^2} + (\sigma^2/n)^2 = \frac{\sigma^4(2n-1)}{n^2} < 2\sigma^4/n$$

for positive n, $2\sigma^4/n < 2\sigma^4/(n-1)$ and then $MSE(\hat{\sigma}^2) < MSE(\hat{\sigma}_{sv}^2)$.

9. Consider the directed graphical model in which none of the variables is observed.

$$a \searrow$$
$$c \to d$$
$$b \nearrow$$

Show that $a \perp b \mid \emptyset$ by using a probability argument. Suppose we now observe the variable d. Show that in general $a \not\perp b \mid d$ (you can use a counterexample).

10. Consider two discrete random variables $x, y \in \{A, B, C\}$. Construct a joint distribution $p(x, y)$ with the following properties:

- $\hat{x}$ is the maximizer of the marginal $p(x)$
- $\hat{y}$ is the maximizer of the marginal $p(y)$
- $p(\hat{x}, \hat{y}) = 0$.

11. Logistic regression for $y \in \{-1, 1\}$ is defined by

$$p(y \mid x; w, b) = \frac{1}{1 + e^{-y(x^\top w + b)}}.$$

Show that logistic regression is in the exponential family, that is, the probability distribution can be written in the form

$$p(y \mid x; \tilde{w}) = \frac{1}{Z(x, \tilde{w})} e^{\phi(y,x)^\top \tilde{w}}.$$

Note the mapping ϕ depends only on y, x, but not on w or b.
